Hyphenation processing and SOFT HYPHEN

SOFT HYPHEN (U+00AD) is used to arbitrarily specify the position of the hyphen in the word. If hyphenation does not occur, SOFT HYPHEN does not affect the display result. You can extend 'hyphenate' to specify whether to hyphenate by SOFT HYPHEN. The setting of hyphenate="none" is available from AH Formatter V7.2.

If hyphenate="true" is specified, normal hyphenation will occur. Hyphenation by dictionary and hyphenation by SOFT HYPHEN are performed.

If hyphenate="false" (default) is specified, hyphenation by the dictionary is not performed, but hyphenation by SOFT HYPHEN is performed.

sample padding padding padding padding padding padding padding hyph-enated

If hyphenate="none" is specified, neither hyphenation by dictionary nor hyphenation by SOFT HYPHEN is performed.
