

Page layout for blank pages

The properties such as `blank`, `not-blank`, `odd-or-even`, and `page-position` define criteria for applying specific styling rules. For 'blank-or-not-blank', it determines if the webpage contains actual content or if it's a blank page rendered because of a style instruction like `break-before: odd-page` or `force-page-count: end-on-even` in CSS. A page that inherits content from an HTML element, even if the content is something like a `<div></div>` that doesn't display anything, is considered non-blank. The values for 'blank-or-not-blank' are: 'blank' (page rendered just to fulfill style requirements); 'not-blank' (page has content); and 'any' (any page). By default, the value is 'any', which always holds true, so 'blank-or-not-blank' is typically left out unless defining styles specifically for blank pages.

This document has only enough text for one page, but `-ah-force-page-count: 3;` is specified to force this page sequence to generate three pages. Two blank pages were generated to satisfy the constraint. `@`-rules for this document specify separate page layout for blank and non-blank pages. The page layout for blank pages specifies a blue background.

The page rule `@page :blank` allows for style specification in each blank page instance.
