

## Position and size of block-container

The block container for which the position is not specified is put following the pre-block.

The block-container for which the position is not specified is put following the pre-block. Moreover, the size is not specified. The width of the content is an included area size.

This block is after the block-container for which the position is not specified.

This is a content of the block-container for which the position is not specified, too. Only the width of the block container is specified for `inline-progression-dimension="50%"`. Height is not specified. Height is decided depending on the content.

This is a content of the block-container for which the position is not specified, too. The width of the block container is specified for `inline-progression-dimension="50%"`, and height is specified for `block-progression-dimension="20%"`. Height is calculated from parents' height (in this case, height of the body area) as follows.  $((\text{page-height} - (\text{page:margin-top} + \text{page:margin-bottom}) - (\text{region-body:margin-top} + \text{region-body:margin-bottom})) * 0.20 = 279 - (10 + 10) - (20 + 20)) = 219 * 20\% = 43.8\text{mm}$

This is a content of the block-container for which the position is not specified, too. The width of the block container is specified for `inline-progression-dimension="50%"`, and height is specified for `block-progression-dimension="43.8mm"`.

This is a content of the block-container for which the position is not specified, too. The width of the block container is specified for `inline-progression-dimension.minimum="30em"`, and height is specified for `block-progression-dimension.minimum="2em"`. It can be specified like this by the minimum value.

The same minimum value as the pre-block container is specified.

This is a content of the block-container for which the position is not specified, too. The width of the block container is specified for `inline-progression-dimension.maximum="30em"`, and height is specified for `block-progression-dimension.maximum="3em"`. It can be specified like this by the maximum value.

The same maximum value as the pre-block container is specified.

If the content of the block container for which height is not specified overflows, the page breaks in the block container. If the content of the block container for which height is not specified overflows, the page breaks in the block container. If the content of the block container for which height is not specified overflows, the page breaks in the block container. If the content of the block container for which height is not specified overflows, the page

breaks in the block container. If the content of the block container for which height is not specified overflows, the page breaks in the block container. If the content of the block container for which height is not specified overflows, the page breaks in the block container.

## Position and size of block-container(Multi Column)

The block container for which the position is not specified is put following the pre-block.

The block-container for which the position is not specified is put following the pre-block. Moreover, the size is not specified. The width of the content is an included area size.

This block is after the block-container for which the position is not specified.

This is a content of the block-container for which the position is not specified, too. Only the width of the block container is specified for inline-progression-dimension="50%". Height is not specified. Height is decided depending on the content.

This is a content of the block-container for which the position is not specified, too. The width of the block container is specified for inline-progression-dimension="50%", and height is specified for block-progression-dimension="20%".

This is a content of the block-container for which the position is not specified, too. The width of the block container is specified for inline-progression-dimension="50%", and height is specified for block-progression-dimension="43.8mm".

This is a content of the block-container for which the position is not specified, too. The width of the block container is specified for inline-progression-dimension.minimum="30em", and height is specified for block-progression-dimension.minimum="2em".

The same minimum value as the pre-block container is specified.

If the content of the block container for which height is not specified overflows, the page breaks in the block container. If the content of the block container for which height is not

specified overflows, the page breaks in the block container. If the content of the block container for which height is not specified overflows, the page breaks in the block container. If the content of the block container for which height is not specified overflows, the page breaks in the block container. If the content of the block container for which height is not specified overflows, the page breaks in the block container. If the content of the block container for which height is not specified overflows, the page breaks in the block container.
