Printing program source code

Generally, monospace font is used when printing the source code written by C or Java. Also, as white space code has an important meaning, we cannot discard it when printing the source code.

In such case, by setting the property of font-family="monospace" white-space="pre" to fo:block, white space in the code can be printed easily in monospace mode, without ignored.

The following example is made only by pasting the program code to fo:block with no change.

```c
void main(void)
{
    printf("Hello, XML world!");
}
```
