Text or graphic in change bar

This sample page demonstrates how to create change bars with notes using CSS for paged media with Antenna House Formatter. In this example, the `.changed1` and `.changed2` classes are used to mark the paragraphs that have changes. The `::before` pseudo-element is used to insert the change bar and note content, while the `::after` pseudo-element closes the change bar span. The `-ah-change-bar-*` properties control the appearance and positioning of the change bars, and standard CSS properties are used to style the note content and adjust the layout.
