Formatter has extensions to customize the spacing around punctuation. These are used mostly for documents in European languages.

```
The following XSL-FO code was originally present in the
fo:declarations element of the XSL-FO document:
```

```
<axf:space-after-punctuation code="." space="2in" language="en"/>
```

```
This is an Antenna House Formatter specific instruction. In an
HTML+CSS workflow, this global setting is typically configured via
an Antenna House Formatter options file (e.g., config.xml) rather
than a direct CSS rule in the stylesheet. The Formatter will apply
this setting based on the content of config.xml when processing the
document.
```

This paragraph has the HTML attribute lang="en".   This will cause the punctuation spacing (defined in config.   xml) to be applied, and there will be 2 inches of space after the periods.   The first paragraph does not have the lang="en" attribute, so the extension isn't applied to it.
