

Punctuation spacing extensions

Antenna House Formatter provides extensions for adjusting the amount of space before and after punctuation in European typography. Although these features cannot be used as a style in CSS, the setting of `space-end-punctuation` in the Option Setting File is effective. This sample demonstrates `space-end-punctuation`, which specifies the amount of space after punctuation. The spacing is applied to elements with the appropriate 'lang' attribute that matches the language specified in the configuration. Punctuation spacing extensions are available with Antenna House Formatter V7.4 and later.

The Option Setting File for this sample includes:

```
<space-end-punctuation language="fr" code="." space="16pt" />
```

This block, and only this block, has the attribute `lang="fr"`. This causes the spacing extension to be applied so there is 16pt of space after each period. See!
