

Border extensions for rounded corners

As a type of border, a radius border can be drawn by using `axf:border-radius`. Specify such as `axf:border-radius="15pt 10pt"`, then the default value will be set as a horizontal diameter (vertical diameter when a 'writing-mode' is 'vertical'). The second value is the other diameter. If omitted, it will be regarded as a default value, and it cannot be rounded if either diameter is less than zero.

Here is an example without specification.

Here is an example of `<fo:block>` with `axf:border-radius="15pt 10pt"` specified.

Here is an example with `axf:border-radius="25pt 25pt"` specified.

Here is an example with `axf:border-radius="50% 50%"` specified.
