Overflow extension

If text cannot fit within (i.e., overflows) a fixed-size <fo:block-container> or <fo:inline-container>, the original text can be substituted with a different character string by specifying overflow="replace" and 'axf:overflow-replace'. Also, by specifying overflow="condense" and 'axf:overflow-condense', etc., you can condense text, reduce the character size, reduce the line spacing, etc.

When not specified
