

Hyphenation of hyphenated words

You can use '[axf:hyphenate-hyphenated-word](#)' to control whether or not a hyphenated word (for example, "hyphenated-word" in these samples) can be further hyphenated.

When `axf:hyphenate-hyphenated-word="true"` (default value) is specified, normal hyphenation is performed when the existing hyphen is not at the end of line.

a padding padding padding padding padding padding padding padding **hyphenated-**
word
padding padding padding padding padding padding padding padding **hy-**
phenated-word

When `axf:hyphenate-hyphenated-word="false"` is specified, an already hyphenated word will not be further hyphenated. A line break can occur only at an existing hyphen.
