

Scaling the background image

You can scale a 'background-image' that is specified on <fo:simple-page-master>. Use 'axf:background-content-height' and 'axf:background-content-width' for the adjustment. The image on this page is expanded by using axf:background-content-height="200pt". With Antenna House Formatter V6.6 or later, ['axf:background-size'](#) should be used instead of 'axf:background-content-height' and 'axf:background-content-width'.
