

Multiple background images

Multiple background images separated by commas may be specified as the value of the 'background-image' property. The images are drawn with the first specified image on top and each subsequent image behind the previous image. All of the other background image-related properties may also be specified as multiple comma-separated values. For those properties, each value in sequence applies to the corresponding 'background-image' image. Excess values are ignored. If a property contains fewer comma-separated values than there are background images, then the last specified value is used for the remaining images. If a background-related property is not specified, then the initial value for that property is used for all background images of the formatting object. Multiple background images are available with Antenna House Formatter V6.6 and later.

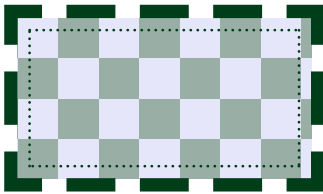

In the following examples, the dotted border indicates the extent of the content box of the outer block, and the text indicates the 'axf:background-clip' value. All background images are the same size.

The examples use these images for the first and second background images, respectively:

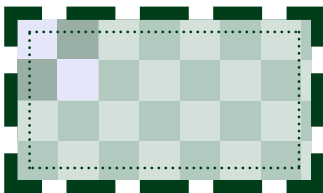

No other properties

Both images are repeated horizontally and vertically, but the first image obscures the second.

background-repeat="no-repeat, repeat"

Only the second image is repeated horizontally and vertically.

background-repeat="no-repeat" background-position="0 0, 100% 100%, 67% 33%" axf:background-origin="padding-box, content-box"

The single 'background-repeat' value is also used for the second image. The third 'background-position' value is ignored because there are only two background images. Separate 'axf:background-position' values are applied to each background image.
